Weekly MORBIDITY REPORT

SHORE STATIONS IN CONTINENTAL UNITED STATES

NAVMED 104

WEEK ENDING 1 March 1947

REPORT NO. 270

ARMY
MEDICAL
JUL 21 1947
LIBRARY

RESTRICTED—THE INFORMATION IN THIS REPORT IS NOT TO BE COMMUNICATED DIRECTLY OR INDIRECTLY TO THE PRESS OR TO ANYONE NOT IN THE ARMED FORCES

This report presents (1) rates and frequencies of admissions for all causes and (2) incidence of selected communicable diseases in the continental naval stations and Marine Corps activities. All admissions and incidence rates are computed as annual rates per 1,000 reported average strength.

For individual stations the reports are presented as numbers of cases, rather than rates, to facilitate evaluation of reports from small stations. The average strength of each individual station is furnished so that rates may be calculated where desired.

The admission rate, total for all causes, is calculated from the total number of A's (New Admissions) and RA's (Readmissions), which comprise the number of individuals taken up on the sick list from a duty status. It should be noted that these rates are computed on an annual basis, and indicate the number of admissions per 1,000 average strength which would occur over a year's time if the current week's experience continued for a year. The formula for computation is as follows:

$$\frac{\text{Number of Admissions (A+RA) During Week X 52}}{\text{Average Strength for Week}} \times 1,000$$

The incidence rate measures the number of new cases of a specific diagnosis or group of diagnoses occurring within the strength during a particular period. This rate is computed from the total of A (New Admissions), ACD (Admitted Contributory Disability), AD (Additional Diagnosis) and EC (Diagnosis Established or Corrected). The computation of rates for incidence follows the formula set up for admission rates by inserting incidence in place of admissions.

Since patients may be transferred to naval hospitals before a diagnosis is established, the category DU (Diagnosis Undetermined) is now included in this report. Some of the cases reported under Diagnosis Undetermined will ultimately be established and reported under one of the specific diagnoses included in this publication. Therefore, comparison of the incidence of DU's in a group of stations with the incidence of a specific diagnosis as reported by the hospitals serving those stations, will provide a rough indication of the diagnosis to which the DU's are eventually assigned. To facilitate such comparisons, hospitals are listed separately under the stations of each Naval District and included in the totals for the district.

Caution should be exercised in the interpretation of this data compared to that published prior to 23 November 1946 in the Weekly Morbidity Report. Previously, the rates were derived from A's (New admissions) only. Present reporting provides a more complete picture of morbidity in the continental activities of the Navy and Marine Corps.

CURRENT TRENDS

Influenza

For the week ending 1 March there were 111 cases of influenza reported by continental activities. This more than doubles the incidence of the previous week which was 46 and nearly doubles the total incidence of 67 for the period 1 January to 22 February. Most of the current cases were concentrated in four activities -- NATechTraCen, Memphis (70); NAS, St. Louis (19); Ship Yard, Mare Island (8); and NavCruit, Baltimore (6). The remaining stations reporting incidence had only single cases.

It is apparent that the disease has reached its peak at Mare Island, since during the week, the incidence dropped from 35 to 8. However, NAS, St. Louis reported an increase from 6 for the week ending 22 February to 19 for the current week. Furthermore, NATechTraCen, Memphis, reporting 70 cases for the week ending 1 March, had none the previous week.

The upward spurt in influenza in the Navy and Marine Corps during the past two weeks may indicate a higher and more wide spread incidence before the winter season is over.

WEEKLY MORBIDITY REPORT
